Introduction

The overall aim of the Habitats Directive is to maintain or restore the favourable conservation status of habitats and species of community interest. These habitats and species are listed in the Habitats and Birds Directives and Special Areas of Conservation and Special Protection Areas are designated to afford protection to the most vulnerable of them. These two designations are collectively known as the Natura 2000 network.

European and national legislation places a collective obligation on Ireland and its citizens to maintain habitats and species in the Natura 2000 network at favourable conservation condition. The Government and its agencies are responsible for the implementation and enforcement of regulations that will ensure the ecological integrity of these sites.

A site-specific conservation objective aims to define favourable conservation condition for a particular habitat or species at that site.

The maintenance of habitats and species within Natura 2000 sites at favourable conservation condition will contribute to the overall maintenance of favourable conservation status of those habitats and species at a national level.

Favourable conservation status of a habitat is achieved when:
- its natural range, and area it covers within that range, are stable or increasing, and
- the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future, and
- the conservation status of its typical species is favourable.

The favourable conservation status of a species is achieved when:
- population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and
- the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and
- there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis.

Notes/Guidelines:

1. The targets given in these conservation objectives are based on best available information at the time of writing. As more information becomes available, targets for attributes may change. These will be updated periodically, as necessary.
2. An appropriate assessment based on these conservation objectives will remain valid even if the targets are subsequently updated, providing they were the most recent objectives available when the assessment was carried out. It is essential that the date and version are included when objectives are cited.
3. Assessments cannot consider an attribute in isolation from the others listed for that habitat or species, or for other habitats and species listed for that site. A plan or project with an apparently small impact on one attribute may have a significant impact on another.
4. Please note that the maps included in this document do not necessarily show the entire extent of the habitats and species for which the site is listed. This should be borne in mind when appropriate assessments are being carried out.
5. When using these objectives, it is essential that the relevant backing/supporting documents are consulted, particularly where instructed in the targets or notes for a particular attribute.

Conservation Objectives for: Mount Hevey Bog SAC [002342]

To restore the favourable conservation condition of Active raised bogs in Mount Hevey Bog SAC, which is defined by the following list of attributes and targets:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Measure</th>
<th>Target</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Habitat area</td>
<td>Hectares</td>
<td>Restore area of active raised bog to 77.8ha, subject to natural processes</td>
<td>Active Raised Bog (ARB) habitat is estimated to be 60.0ha. Area of Degraded Raised Bog (DRB) on the High Bog (HB) has been modelled as 24.5ha. See map 2. However, it is estimated that only 12.3ha is potentially restorable to ARB by drain blocking. The total potential ARB on the HB is therefore estimated to be 72.3ha. Eco-hydrological assessments of the cutover estimates that an additional 5.5ha of bog forming habitats could be restored. The long term target for ARB is therefore 77.8ha. See raised bog supporting document for further details on this and following attributes.</td>
</tr>
<tr>
<td>Habitat distribution</td>
<td>Occurrence</td>
<td>Restore the distribution and variability of active raised bog across the SAC. See map 3 for distribution in 2000</td>
<td>ARB habitat at Mount Hevey Bog comprises central and sub-central ecotopes and active flush and occurs on both parts of the bog. DRB also occurs on both parts of the bog, which will require restoration measures. There is also potential for ARB restoration on cutover areas of the bog (see area target above)</td>
</tr>
<tr>
<td>High bog area</td>
<td>Hectares</td>
<td>No decline in extent of high bog necessary to support the development and maintenance of active raised bog. See map 2</td>
<td>The area of high bog within Mount Hevey Bog SAC in 2012 (latest figure available) was 217.5ha (DAHG 2014)</td>
</tr>
<tr>
<td>Hydrological regime: water levels</td>
<td>Centimetres</td>
<td>Restore appropriate water levels throughout the site</td>
<td>For ARB, mean water level needs to be near or above the surface of the bog lawns for most of the year. Seasonal fluctuations should not exceed 20cm, and should only be 10cm below the surface, except for very short periods of time.</td>
</tr>
<tr>
<td>Hydrological regime: flow patterns</td>
<td>Flow direction; slope</td>
<td>Restore, where possible, appropriate high bog topography, flow directions and slopes. See map 4 for current situation</td>
<td>ARB depends on mean water levels being near or above the surface of bog lawns for most of the year. Long and gentle slopes are the most favourable to achieve these conditions. Changes to flow directions due to subsidence of bogs can radically change water regimes and cause drying out of high quality ARB</td>
</tr>
<tr>
<td>Transitional areas between high bog and adjacent mineral soils (including cutover areas)</td>
<td>Hectares; distribution</td>
<td>Restore adequate transitional areas to support/protect active raised bog and the services it provides</td>
<td>No natural margins remain around Mount Hevey Bog. In places, bog vegetation is regenerating on long abandoned cutover. Eco-hydrological assessments have evaluated the potential for ARB restoration on cutover areas (see note for habitat area attribute above)</td>
</tr>
<tr>
<td>Vegetation quality: central ecotope, active flush, soaks, bog woodland</td>
<td>Hectares</td>
<td>Restore 38.9ha of central ecotope/active flush/soaks/bog woodland as appropriate</td>
<td>At least 50% of active raised bog habitat should be high quality (i.e. central ecotop, active flush, soaks, bog woodland. Target area of active raised bog for the site has been set at 77.8ha (see area target above)</td>
</tr>
<tr>
<td>Vegetation quality: microtopographical features</td>
<td>Hectares</td>
<td>Restore adequate cover of high quality microtopographical features</td>
<td>Hummock and hollow microtopography is well developed in the western part of Mount Hevey Bog. Previous drainage efforts associated with a forestry plantation (which has since been clear felled) on the high bog on the eastern side have had a negative effect on the surface microtopography</td>
</tr>
<tr>
<td>Vegetation quality: bog moss (Sphagnum) species</td>
<td>Percentage cover</td>
<td>Restore adequate cover of bog moss (Sphagnum) species to ensure peat-forming capacity</td>
<td>Sphagnum cover varies naturally across Ireland with relatively high cover in the east to lower cover in the west. Hummock forming species such as Sphagnum austini are particularly good peat formers. Sphagnum cover and distribution also varies naturally across a site</td>
</tr>
<tr>
<td><strong>Typical ARB species: flora</strong></td>
<td><strong>Occurrence</strong></td>
<td><strong>Typical flora species include widespread species, as well as those with more restricted distributions but typical of the habitat's subtypes or geographical range</strong></td>
<td></td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td><strong>Typical ARB species: fauna</strong></td>
<td><strong>Occurrence</strong></td>
<td><strong>Typical fauna species include widespread species, as well as those with more restricted distributions but typical of the habitat's subtypes or geographical range</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Elements of local distinctiveness</strong></td>
<td><strong>Occurrence</strong></td>
<td><strong>The main feature of interest is a small lough that occurred on the west side of the bog (Cloncraive Lough), which has infilled and now corresponds with active flush</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Negative physical indicators</strong></td>
<td><strong>Percentage cover</strong></td>
<td><strong>Negative physical indicators include: bare peat, algae dominated pools and hollows, marginal cracks, tear patterns, subsidence features such as dry mineral mounds /ridges emerging or expanding and evidence of burning</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Vegetation composition: native negative indicator species</strong></td>
<td><strong>Percentage cover</strong></td>
<td><strong>Native negative indicator species at insignificant levels</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Vegetation composition: non-native invasive species</strong></td>
<td><strong>Percentage cover</strong></td>
<td><strong>Non-native invasive species at insignificant levels and not more than 1% cover</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Air quality: nitrogen deposition</strong></td>
<td><strong>kg N/ha/year</strong></td>
<td><strong>Air quality surrounding bog close to natural reference conditions. The total N deposition should not exceed 5kg N/ha/yr</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Water quality</strong></td>
<td><strong>Hydrochemical measures</strong></td>
<td><strong>Water quality on the high bog and transitional areas close to natural reference conditions</strong></td>
<td></td>
</tr>
</tbody>
</table>

Most common non-native invasive species on raised bogs include lodgepole pine (Pinus contorta), rhododendron (Rhododendron ponticum), and pitcherplant (Sarracenia purpurea).
7120  Degraded raised bogs still capable of natural regeneration

The long-term aim for Degraded raised bogs still capable of natural regeneration is that its peat-forming capability is re-established; therefore, the conservation objective for this habitat is inherently linked to that of Active raised bogs (7110) and a separate conservation objective has not been set in Mount Hevey Bog SAC.

</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Depressions on peat substrates of the Rhynchosporion is an integral part of good quality Active raised bogs (7110) and thus a separate conservation objective has not been set for the habitat in Mount Hevey Bog SAC.
