Conservation Objectives Series

Lisbigney Bog SAC 000869
**Introduction**

The overall aim of the Habitats Directive is to maintain or restore the favourable conservation status of habitats and species of community interest. These habitats and species are listed in the Habitats and Birds Directives and Special Areas of Conservation and Special Protection Areas are designated to afford protection to the most vulnerable of them. These two designations are collectively known as the Natura 2000 network.

European and national legislation places a collective obligation on Ireland and its citizens to maintain habitats and species in the Natura 2000 network at favourable conservation condition. The Government and its agencies are responsible for the implementation and enforcement of regulations that will ensure the ecological integrity of these sites.

A site-specific conservation objective aims to define favourable conservation condition for a particular habitat or species at that site.

The maintenance of habitats and species within Natura 2000 sites at favourable conservation condition will contribute to the overall maintenance of favourable conservation status of those habitats and species at a national level.

Favourable conservation status of a habitat is achieved when:

- its natural range, and area it covers within that range, are stable or increasing, and
- the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future, and
- the conservation status of its typical species is favourable.

The favourable conservation status of a species is achieved when:

- population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and
- the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and
- there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis.

**Notes/Guidelines:**

1. The targets given in these conservation objectives are based on best available information at the time of writing. As more information becomes available, targets for attributes may change. These will be updated periodically, as necessary.
2. An appropriate assessment based on these conservation objectives will remain valid even if the targets are subsequently updated, providing they were the most recent objectives available when the assessment was carried out. It is essential that the date and version are included when objectives are cited.
3. Assessments cannot consider an attribute in isolation from the others listed for that habitat or species, or for other habitats and species listed for that site. A plan or project with an apparently small impact on one attribute may have a significant impact on another.
4. Please note that the maps included in this document do not necessarily show the entire extent of the habitats and species for which the site is listed. This should be borne in mind when appropriate assessments are being carried out.
5. When using these objectives, it is essential that the relevant backing/supporting documents are consulted, particularly where instructed in the targets or notes for a particular attribute.

### Conservation Objectives for: Lisbigney Bog SAC [000869]

#### 7210 Calcareous fens with Cladium mariscus and species of the Caricion davallianae*

To restore the favourable conservation condition of Calcareous fens with *Cladium mariscus* and species of the Caricion davallianae* in Lisbigney Bog SAC, which is defined by the following list of attributes and targets:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Measure</th>
<th>Target</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Habitat area</td>
<td>Hectares</td>
<td>Area stable or increasing, subject to natural processes</td>
<td>The indicative area of the priority Annex I habitat Calcareous fens with <em>Cladium mariscus</em> and species of the Caricion davallianae* in Lisbigney Bog SAC has been mapped as 9.91ha (NPWS internal files). See map 2. The habitat occurs in association with other fen, marsh and common reed (<em>Phragmites australis</em>) swamp vegetation in the SAC (NPWS, 2005; Farrell, 1972; NPWS internal files)</td>
</tr>
<tr>
<td>Habitat distribution</td>
<td>Occurrence</td>
<td>No decline, subject to natural processes</td>
<td>See map 2 for the indicative distribution of the habitat in the SAC (NPWS internal files)</td>
</tr>
<tr>
<td>Ecosystem function: soil nutrients</td>
<td>Soil pH and appropriate nutrient levels at a representative number of monitoring stops</td>
<td>Maintain/restore soil pH and nutrient status within natural ranges</td>
<td>Relevant nutrients and their natural ranges are yet to be defined. Increased nutrients can lead to changes in plant and invertebrate species through competition and subsequent structural changes to micro-habitat. These nutrients favour growth of grasses rather than forbs and mosses and leads to a higher and denser sward</td>
</tr>
<tr>
<td>Ecosystem function: peat formation</td>
<td>Percentage cover of peat-forming vegetation and water table levels</td>
<td>Maintain active peat formation, where appropriate</td>
<td>In order for peat to form, water levels need to be slightly below or above the soil surface for c.90% of the time</td>
</tr>
<tr>
<td>Ecosystem function: hydrology - groundwater levels</td>
<td>Water levels (centimetres); duration of levels; hydraulic gradients; water supply</td>
<td>Restore appropriate natural hydrological regimes necessary to support the natural structure and functioning of the habitat</td>
<td>Fen habitats require high groundwater levels (i.e. water levels at or above the ground surface) for a large proportion of the calendar year (i.e. duration of mean groundwater level). Fen groundwater levels are controlled by regional groundwater levels in the contributing catchment area (which sustain the hydraulic gradients of the fen groundwater table). Regional abstraction of groundwater may affect fen groundwater levels. In this SAC, the water table level has been noted as significantly below the requirements for <em>Cladium</em> fen (NPWS, 2005)</td>
</tr>
<tr>
<td>Ecosystem function: hydrology - surface water flow</td>
<td>Drain density and form</td>
<td>Restore as close as possible to natural or semi-natural, drainage conditions</td>
<td>Drainage, either within or surrounding the fen habitat, can result in the drawdown of the groundwater table. The depth, geometry and density of drainage (hydromorphology) will indicate the scale and impact on fen hydrology. Drainage can result in loss of characteristic species and transition to drier habitats. A network of drainage ditches cross the SAC and drainage is a significant issue for the habitat (NPWS, 2005; NPWS internal files)</td>
</tr>
<tr>
<td>Ecosystem function: water quality</td>
<td>Various</td>
<td>Maintain/restore appropriate water quality, particularly pH and nutrient levels, to support the natural structure and functioning of the habitat</td>
<td>Fens receive natural levels of nutrients (e.g. iron, magnesium and calcium) from water sources. However, they are generally poor in nitrogen and phosphorus, with the latter tending to be the limiting nutrient under natural conditions. Water supply should be also relatively calcium-rich. Water drains into the habitat in the SAC from the surrounding intensively managed farmland; hence any fertilisers, herbicides or pesticides used on the farms may be washed into the SAC (NPWS, 2005)</td>
</tr>
<tr>
<td>Vegetation composition: cover of Cladium mariscus</td>
<td>Percentage cover at a representative number monitoring stops</td>
<td>Cover of <em>Cladium mariscus</em> at least 25%</td>
<td>Attribute and target based on O’Neill et al. (in prep.)</td>
</tr>
</tbody>
</table>
## Vegetation composition:
- **Typical vascular plants**
  - Percentage cover at a representative number of monitoring stops
  - Maintain/restore adequate cover of typical vascular plant species

For lists of typical vascular plant species, including high quality indicators, see O'Neill et al. (in prep.). Typical vascular plant species that have been recorded in the habitat in the SAC include great fen-sedge (*Cladium mariscus*), black bog-rush (*Schoenus nigricans*), purple moor-grass (*Molinia caerulea*), purple loosestrife (*Lythrum salicaria*), common valerian (*Valeriana officinalis*), marsh cinquefoil (*Comarum palustre*), marsh marigold (*Caltha palustris*), wild angelica (*Angelica sylvestris*), meadow thistle (*Cirsium dissectum*), meadowsweet (*Filipendula ulmaria*) and water horsetail (*Equisetum fluviatile*) (NPWS, 2005).

## Vegetation composition:
- **Native negative indicator species**
  - Percentage cover at a representative number of monitoring stops
  - Cover of native negative indicator species at insignificant levels

Negative indicators include species not characteristic of the habitat and species indicative of undesirable activities such as overgrazing, undergrazing, nutrient enrichment, agricultural improvement or impacts on hydrology. Native negative indicators may include *Anthoxanthum odoratum*, *Epilobium hirsutum*, *Holcus lanatus*, *Juncus effusus*, *Phragmites australis*, *Ranunculus repens* and *Typha latifolia*. See O'Neill et al. (in prep.)

## Vegetation composition:
- **Non-native species**
  - Percentage cover at a representative number of monitoring stops
  - Cover of non-native species less than 1%

Attribute and target based on O'Neill et al. (in prep.). Non-native species can be invasive and have deleterious effects on native vegetation. A low target is set as non-native species can spread rapidly and are most easily dealt with when still at lower abundances.

## Vegetation composition:
- **Native trees and shrubs**
  - Percentage cover in local vicinity of a representative number of monitoring stops
  - Cover of scattered native trees and shrubs less than 10%

Attribute and target based on O'Neill et al. (in prep.). Scrub and trees will tend to invade if fen conditions become drier. In the fen habitat in this SAC, scrub encroachment by birch (*Betula* sp.), gorse (*Ulex europaeus*) and willow (*Salix* sp.) scrub has been reported, as well as the occurrence of several mature Scots pine trees (*Pinus sylvestris*) (NPWS, 2005).

## Vegetation composition:
- **Algal cover**
  - Percentage cover at, and in local vicinity of, a representative number of monitoring stops
  - Cover of algae less than 2%

Attribute and target based on O'Neill et al. (in prep.). Algal cover is indicative of nutrient enrichment from multiple sources (McBride et al., 2011).

## Vegetation structure:
- **Vegetation height**
  - Percentage cover at a representative number of monitoring stops
  - At least 10% of live shoots more than 1m high

Attribute and target based on O'Neill et al. (in prep.)

## Physical structure:
- **Disturbed bare ground**
  - Percentage cover at, and in local vicinity of, a representative number of monitoring stops
  - Cover of disturbed bare ground not more than 10%

Attribute and target based on O'Neill et al. (in prep.). While grazing may be appropriate in this habitat, excessive areas of disturbed bare ground may develop due to unsuitable grazing regimes. Disturbance can include hoof marks, wallows, human footprints, vehicle and machinery tracks. Excessive disturbance can result in loss of characteristic species and presage erosion for peatlands. Burning has been noted as a threat to the fen vegetation in this SAC (NPWS, 2005).

## Physical structure:
- **Tufa formations**
  - Percentage cover in local vicinity of a representative number of monitoring stops
  - Disturbed proportion of vegetation cover where tufa is present is less than 1%

Attribute and target based on O'Neill et al. (in prep.). This includes species on the Flora (Protection) Order, 2015 and/or Red Lists (Byrne et al., 2009; Regan et al., 2010; Lockhart et al., 2012; Wyse Jackson et al., 2016, etc.; see Nelson et al., 2019, 2021). See the conservation objective for the Annex II listed and Endangered (Byrne et al., 2009) Desmoulins's whorl snail (*Vertigo moulini*sa) in this volume.
Transitional areas between fen and adjacent habitats | Maintain/restore adequate transitional areas to support/protect the Cladium fen habitat and the services it provides

In many cases, fens transition to other wetland habitats. It is important that the transitional areas between Cladium fen and other habitats are maintained in as natural condition as possible in order to protect the functioning of the fen. Habitat that is structurally suitable for Desmoulin’s whorl snail (Vertigo mouliniana) should be maintained/restored (see the conservation objective for Desmoulin’s whorl snail in this volume).
To restore the favourable conservation condition of Desmoulin’s Whorl Snail (*Vertigo mouliniana*) in Lisbigney Bog SAC, which is defined by the following list of attributes and targets:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Measure</th>
<th>Target</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution</td>
<td>Number of occupied 1km squares</td>
<td>Population restored to baseline. There is one recorded site for the species in the SAC within the 1km grid square S4479. See map 3</td>
<td>Desmoulin’s whorl snail (<em>Vertigo mouliniana</em>) was last recorded in Lisbigney Bog SAC in 1998 at one site within the 1km grid square S4479; it was not found in 2006, 2010 or 2016. See details for the site Lisbigney Bog (site code VmCAM15) in Moorkens and Killeen (2011), Long and Brophy (2019) and Brophy and Long (2019). Further work is required to definitively establish the status of the species in this SAC.</td>
</tr>
<tr>
<td>Occurrence in suitable habitat</td>
<td>Percentage positive records in a representative number of samples</td>
<td>Restore to self-sustaining population</td>
<td>This attribute should be assessed following the methodology in Long and Brophy (2019), taking a representative number of samples in suitable habitat across the site in an appropriate timeframe to detect successful reproduction. A self-sustaining population will be indicated by detection of both adults and juveniles.</td>
</tr>
<tr>
<td>Habitat area</td>
<td>Hectares</td>
<td>Restore area of suitable habitat, subject to natural processes</td>
<td>In 1998, Desmoulin’s whorl snail (<em>Vertigo mouliniana</em>) was recorded at Lisbigney Bog SAC in swamp and fen vegetation with greater tussock-sedge (<em>Carex paniculata</em>), lesser pond-sedge (<em>C. acutiformis</em>) and meadowsweet (<em>Filipendula ulmaria</em>). It was classified as a mixture of tall herb swamps (FS2) and wet grassland (GS4) of Fossitt (2000). Since then, the habitat has become unsuitable for the species and restoration is required. Optimal and sub-optimal habitat is defined in Moorkens and Killeen (2011) and given in Long and Brophy (2019) and Brophy and Long (2019).</td>
</tr>
<tr>
<td>Habitat quality: water levels</td>
<td>Hydrological regime</td>
<td>Restore suitable hydrological regime, subject to natural processes</td>
<td>Water levels appear to have dropped at this SAC, making conditions unsuitable for Desmoulin’s whorl snail (<em>Vertigo mouliniana</em>)</td>
</tr>
