

METEOROLOGICAL SERVICE

AGROMETEOROLOGICAL BULLETIN

SEPTEMBER 1980

The Weather of September

A ridge of high pressure on the 1st was quickly replaced by a spell of warm and humid conditions on the 2nd and 3rd. In this period there were prolonged spells of heavy rain in many western and northern areas but amounts in southern, eastern and in the midland regions were generally slight. Changeable weather occurred from the 4th to the 7th. Outbreaks of rain were frequent in all areas and amounts in western and southwestern regions were particularly heavy on the 4th.

A west to northwest airflow set in on the 8th. Frequent frontal passages over the following week brought showers and outbreaks of rain to all areas. Maximum daytime temperatures were generally below normal in this spell. With a slight backing of the prevailing winds to southwest or west maximum temperatures recovered to near the normal values but the broken pattern of weather was continued up to the 23rd. Heavy falls of rain occurred in many areas on most days. In particular rain was widespread and heavy on the 21st, especially in southern and eastern regions.

A rise in pressure on the 23rd was generally maintained for the rest of the month. Daily rainfall amounts in most areas were considerably less although the occasional wet day still occurred in this period. It was a little cooler and slight frost occurred in some sheltered areas inland.

Monthly Amounts of Precipitation were above normal everywhere except in the east and southeast. Amounts varied from about 180% of normal in parts of the west and southwest to 98% of normal at Casement. Generally the wettest days occurred on the 4th and 21st and the wettest spell occurred between the 15th and 22nd. The number of wet days was well above average almost everywhere and exceptionally well above average in parts of the west and northwest - 27 wet days occurred at Glenamoy and at Malin Head. The accumulation of weather suitable to the spread of potato blight, especially in the earlier part of the month, was well above average.

Mean Monthly Air Temperature was above normal nearly everywhere and well above normal in most inland areas. Temperatures varied from 1.1 °C above normal at Dublin Airport to about normal at Cahirciveen. Mean soil temperatures (at 100mm) were also above normal nearly everywhere, varying from 0.6 °C above normal in the east and north to 0.3 °C below normal at Shannon Airport. Slight ground frost occurred in a few sheltered areas during the last decade of the month.

Mean Duration of Bright Sunshine was below normal except in the north-midlands. It varied from 100% of normal at Clones to 68% of normal at Cahirciveen. In general the second decade of the month was dullest but in western and northern regions the first decade proved to be dullest.

Gale gusts were frequent throughout the month and were more widespread on the 6th, 7th, from the 10th to the 13th, the 18th, 21st and 22nd. Thunderstorms were reported on the 12th, 16th and 21st.

Summary. The weather was generally broken throughout most of the month. It was the second wettest September in the Cahirciveen areas since 1875. The combined total amounts there for July to September was 520mm.

The data contained in this Bulletin are provisional. Some of the material in Table 1 will be published in its final form later in the Monthly Weather Report; final values of Solar Radiation at stations; marked "e" in Table 2 will be published in the Annual Summary of Solar Radiation.
