Clinical Speech and Language Studies

SLP & Adults with MHDs

- Relatively ‘young’ area of practice: 1.2 SLPs on MDTs (Community & Hospital)
- Speech, language, communication issues
 - intrinsic to MHD
 - assoc with MHD
 - previously undetected

(Brophy, 2009; Brophy & Walsh, 2010; Emerson & Enderby, 1996, France & Muir, 1997, France & Kramer, 2000)
- Language & Communication core to
 - diagnosis
 - treatment e.g. ‘talking therapies’
 - concern re ‘wellness’ & ‘wellbeing’ - SLP has a role

Well being across
the lifespan

Clinical Speech and Language Studies

Impetus for paper (Ethnography of communication disorders ECD)

- An ethnographer...‘must try to understand that community’s culture- its ways of acting in the world and making sense of the world in the way community members understand it themselves’ (*Cameron, 2001, p.47*)
- ECD spawned a variety of discourse-based investigations into the nature of communication disorders and our helping practices (*Kovarsky, 2013*)
- ‘...the purpose of ECD is to illuminate how communication disorders are constructed, made relevant and managed through the culturally situated, communicative activities that bring them to life in the first place” (*Kovarsky, 2013, p.75*).
- Requires a consideration of **i. Culture** and **ii. Community**

Clinical Speech and Language Studies

Culture

Culture of SLP

- habits, routines, expectations, behaviors, values, the talk/discourse (e.g. I/R/F etc).
- traditionally mapping impairment, assessing, evaluating, intervening as ‘expert’
(e.g. Panagos, (1996). Kovarsky et al., 1988; Kovarsky & Crago, 1990; Kovarsky & Duchan, 1997)

Culture of schizophrenia

- the world, language and expectations of the person with schizophrenia in interaction with another/society (Scher, 1994); (experience of psychosis, hallucinations, delusions etc.)
- being ‘inside’ and ‘outside’ of schizophrenia (Frame, 1989; King 2000; Brophy, 2008, 2009)

Service user-perspective *identity* & culture (see Bonney & Stickley, 2008)

- ‘Psychosis as a positive experience’ (Martyn, 2000)
- ‘Being able to return to a psychotic world’ (Gould, 2005)
- ‘Integration of the psychotic experience’ (Repper & Perkins, 2003)
- ‘Glad to hear voices’ (James, 2002)
- ‘Resisting illness identity’ (Campbell, 2001)

Community

Similar to Guendouzi & Müller re people with Dementia (2006; 42 ff)

- Community of people with MHDs is one where participants' communication abilities 'are highly variable and the interactions often unpredictable' (p.52)
- Included in that (speech) community are the people themselves, their families, carers and mental health professionals, including SLPs
- Useful to reflect on 'communication activities' within wider community of practice and how they construct 'communication disorder' in this context

Clinical Speech and Language Studies

What ‘communicative activities’ have brought SLP-MHDs to life and what is the way forward?

Some of the culturally situated, communicative activities that have influenced the development of practice:

- I. Service needs analyses’ reports - screening assessments to identify ‘need’ for SLP services
- II. Textbook titles/accounts: MHDs-SLP
- III. 1st person accounts - past & present

Issue

International Journal of
Language & Communication
Disorders

Volume 31, Issue 3, pages
221–236, July 1996

Abstract

A survey was conducted to investigate the prevalence of speech and language problems in people receiving care from the Mental Health Unit of a District Health Authority. A screening assessment was devised with the aim of detecting difficulties with receptive and expressive language, voice, articulation and fluency, by use of modified standardised tests and subjective ratings. All in-patients who had been in hospital for longer than six months were screened, as were all day patients attending the Integrated Rehabilitation Workshop in the hospital grounds and a random sample of patients attending two day centres in the community. Results showed that moderate or severe difficulties in at least one aspect of speech and language was present in over two-thirds of the 138 people assessed. The most common problems occurred in the tests of comprehension and naming. A quarter of those assessed had problems in spontaneous speech. Problems with voice, articulation and fluency were less common. The limitations on the information obtained due to the nature of the population considered and the assessment procedure, and the implications of the findings for the management of patients are discussed.

Original

A needs analysis for the provision of a speech and language therapy service to adults with mental health disorders

Irene Walsh, Julie Regan, Rebecca Sowman, Brian Parsons, A. Paula McKay

Ir J Psych Med 2007; 24(3): 89-93

Objectives: To examine a sample of adults with mental health disorders attending at an area psychiatric service, for the presence of impairments in language, communication and swallowing, using a test battery administered by speech and language therapists.

Method: The study surveyed a randomly selected sample (n = 60) of patients from an acute psychiatric inpatient unit and associated community services, using several standardised measures of language, communication and swallowing.

Results: On this test battery, over 80% (50/60) of subjects studied demonstrated impairment in language; while over 60% (37/60) presented with impairment in communication and discourse. Over 30% (18/58) of subjects assessed showed some impairment in swallowing.

Conclusion: Use of this test battery confirmed the presence of language, communication and swallowing impairments in many patients in this sample of attenders at a general psychiatry service. We suggest that this study provides evidence for a (currently unmet) need for specialist speech and language therapy assessment and support among this patient population.

‘Poverty of speech’?

Example 1. 2: Poverty of Speech (from C. Frith 1997; 11)

- E:** How're you doing generally at the moment, Mr. D?
- D:** All right.
- E:** You're OK . How're ...How've you been feeling in your spirits this past week?
- D:** Not so bad.
- E:** You're feeling alright. Do you have any spells of feeling sad or miserable?
- D:** No.
- E:** No? Nothing like that? That's good. Now tell me, Mr. D, do you have any special ideas about life in general?
- D:** *(Shakes head)*
- E:** No. Do you feel people stare at you and talk about you in some way?
- D:** *(Shakes head)*
- E:** No. No, you didn't get bothered with that at all. Do you feel in any way| that people are against you and trying to do you harm?
- D:** *(Shakes head)*
- E:** No, you didn't get that either. That's good. Now I'd like to ask you some questions about your thoughts, Mr. D. Do you ever feel that your thoughts or your actions are influenced in some way?
- D:** *(minimal headshake)*
- E:** You didn't get that. You didn't get that. That's fine. Now could I ask you a routine question that we ask everyone? Do you ever....

- Missing voice in evidence-based practice
(Kovarsky & Curran, 2007)
- ‘...individual narratives by people who have experienced mental illness and are living well with their illness, can inform current practices in recovery’ *(Mental Health Commission, 2007)*

	<p>People with schizophrenia: interview data (Brophy, 2009)</p>
<p>Struggle with/in communication</p>	<p><i>‘even myself, when I am talking myself I hear the words coming out of my mouth but I can’t really (3) understand, I think I am talking a load of crap’ (P1 72ff)</i></p>
<p>Other’s perception</p>	<p><i>‘you’re not really sure what you think is important is what they think is important (P7, 593ff)</i> <i>‘friends of mine get frustrated [in communication] and they say “what’s wrong with you WHAT IS WRONG WITH YOU?” (P2, 831ff)</i></p>
<p>Strength/ way forward</p>	<p><i>you know I mean I tend to ask a lot of questions I tend to cope with my lack of speech my asking the other person questions ...to keep the conversation going (P3, 633ff)</i></p> <p><i>‘communication was a way...of therapy, it was a way of getting myself well’ (P2, 583ff)</i></p>

Clinical Speech and Language Studies

'Recovery' in MHDs

It is a means to develop a 'new meaning and purpose in one's life as one grows beyond the catastrophic effects of [psychiatric] illness'

(Anthony, 1993; 527)

Recovery Model

'Living with' mental health difficulty

Person as an active agent in the recovery process

Recovery is something a person does, not something that is done to them

Collaboration

SLP social model

'Living with' communication disorder

Goal setting from perspective of the person

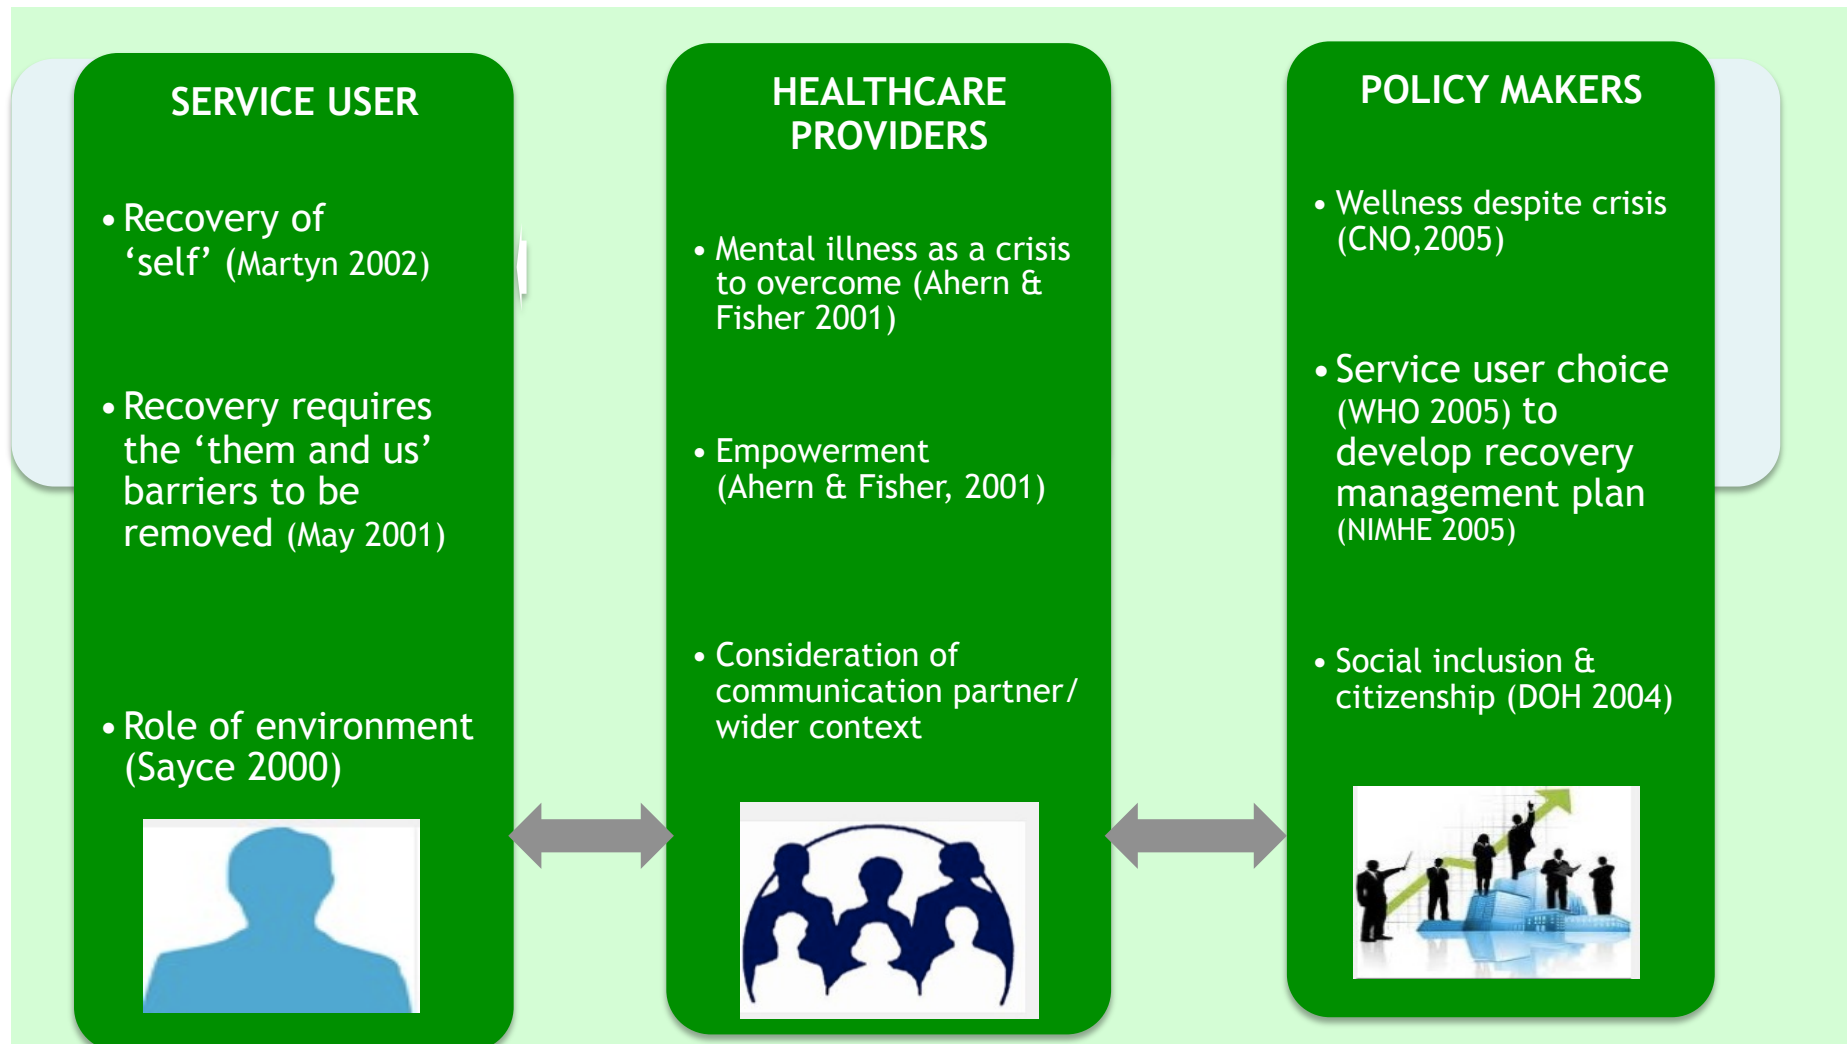

Authentic involvement of the person

Partnership

Clinical Speech and Language Studies (adapted from Bonney & Stickley, 2008)

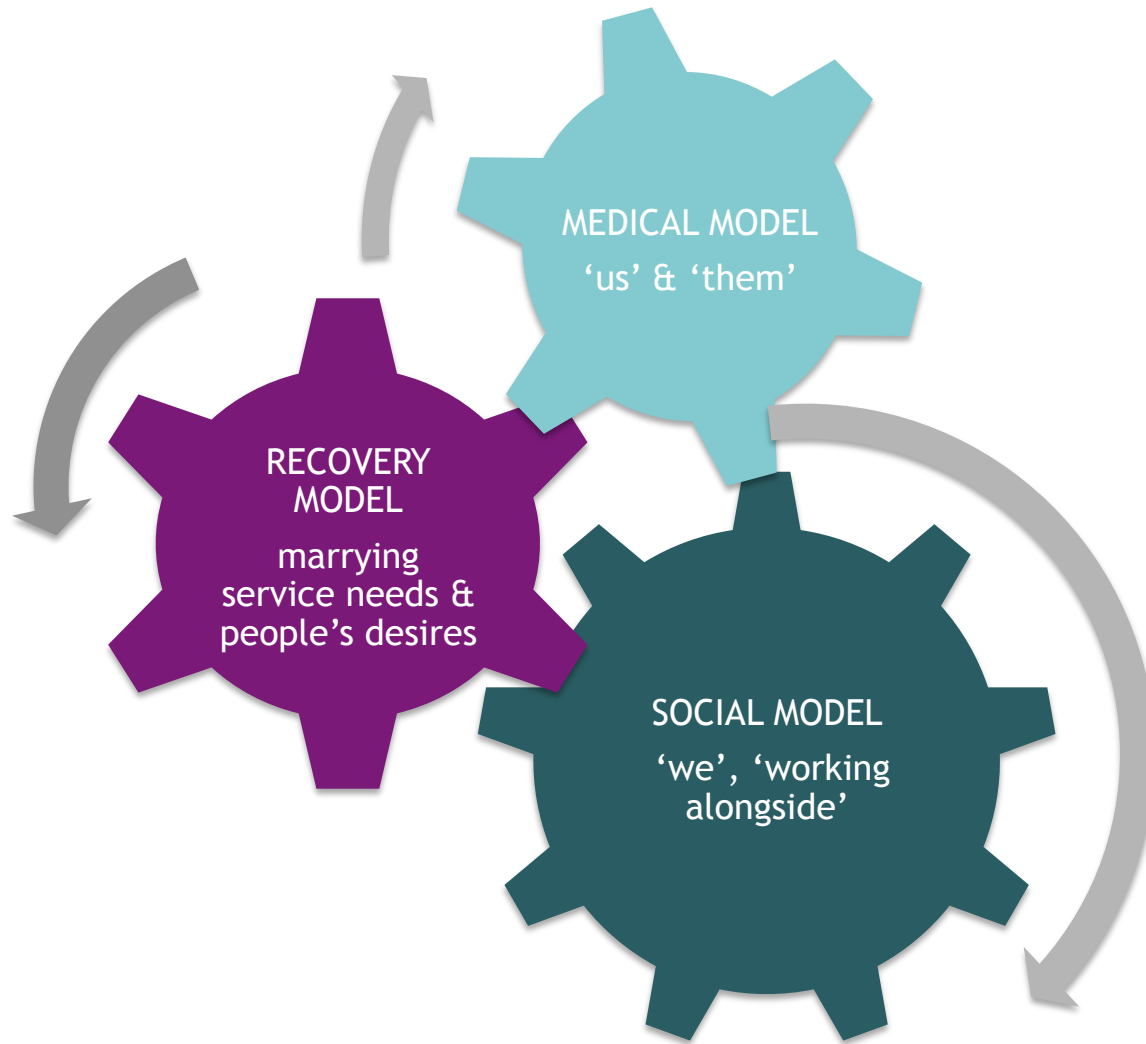

Recovery in the (speech) communication ‘community’

Clinical Speech and Language Studies

Conclusion

'Revaluing madness
without romanticizing or
denying difficulties'
(Sayce 2000)
